

Project Name

Strategic product placement analysis

Preprocessing Steps

1. Conducted an initial scan of the raw dataset and confirmed that all structural dimensions and operational measures were fully populated.
2. Verified that there are no missing values and no duplicates in the dataset.
3. All datatypes are automatically mapped correctly without requiring manual conversion.
4. Created two calculated fields:

Price Difference calculation:

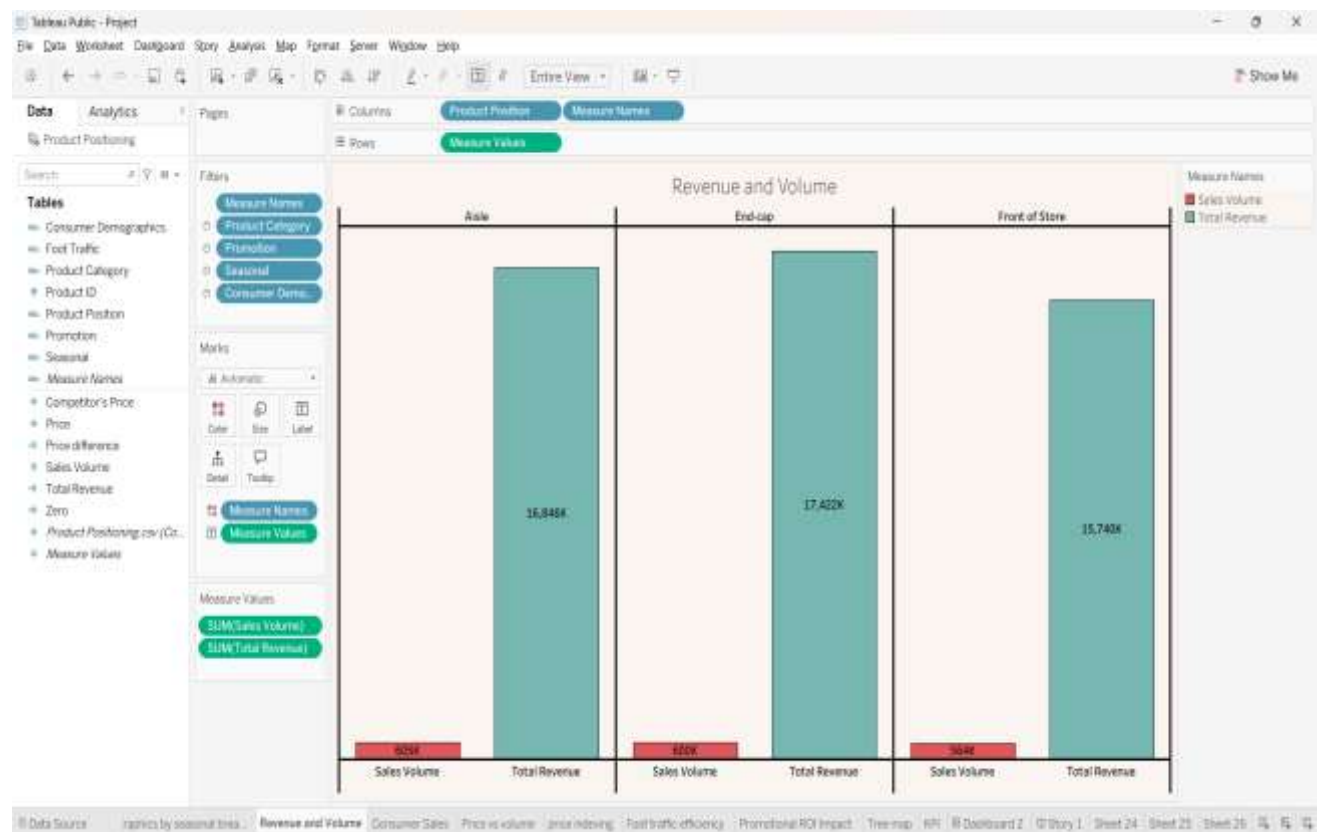

Syntax: [Price] - [Competitor's Price]

Total Revenue calculation:

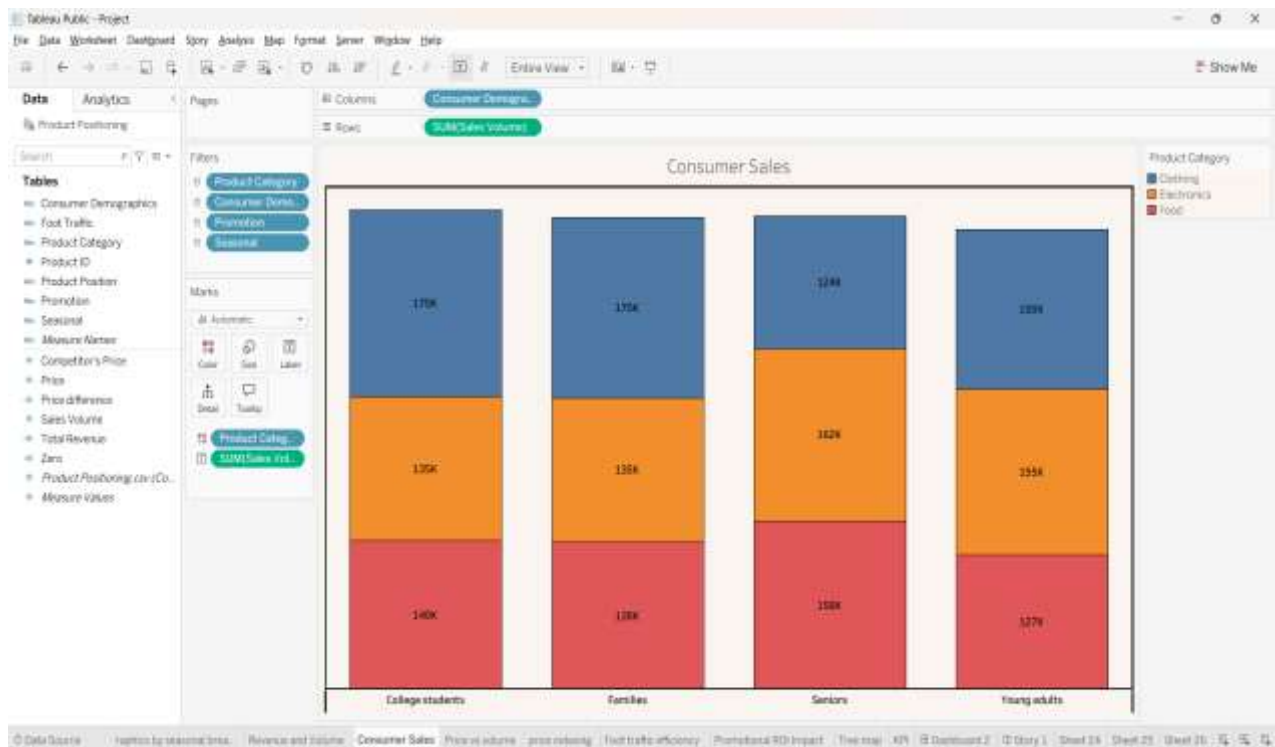

Syntax: [Sales Volume] * [Price]

Business Questions with visualizations

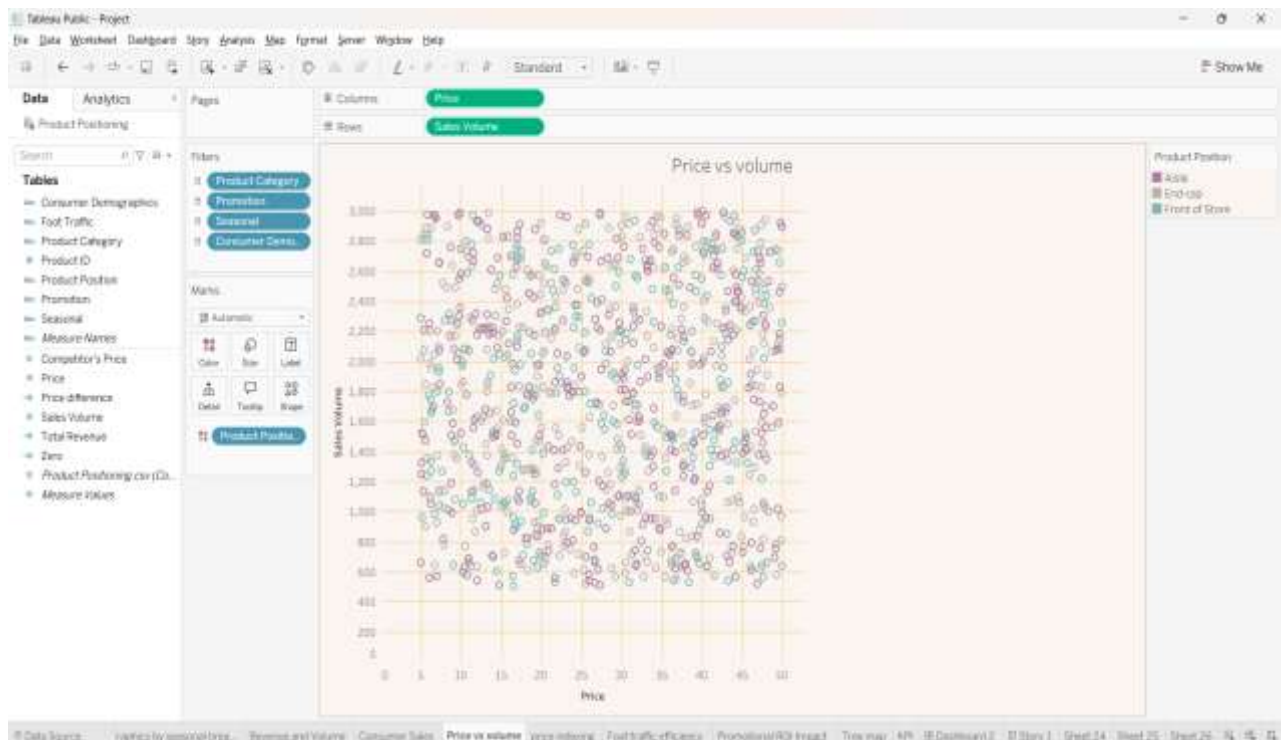

1. Which product position drives highest total revenue versus sales volume?

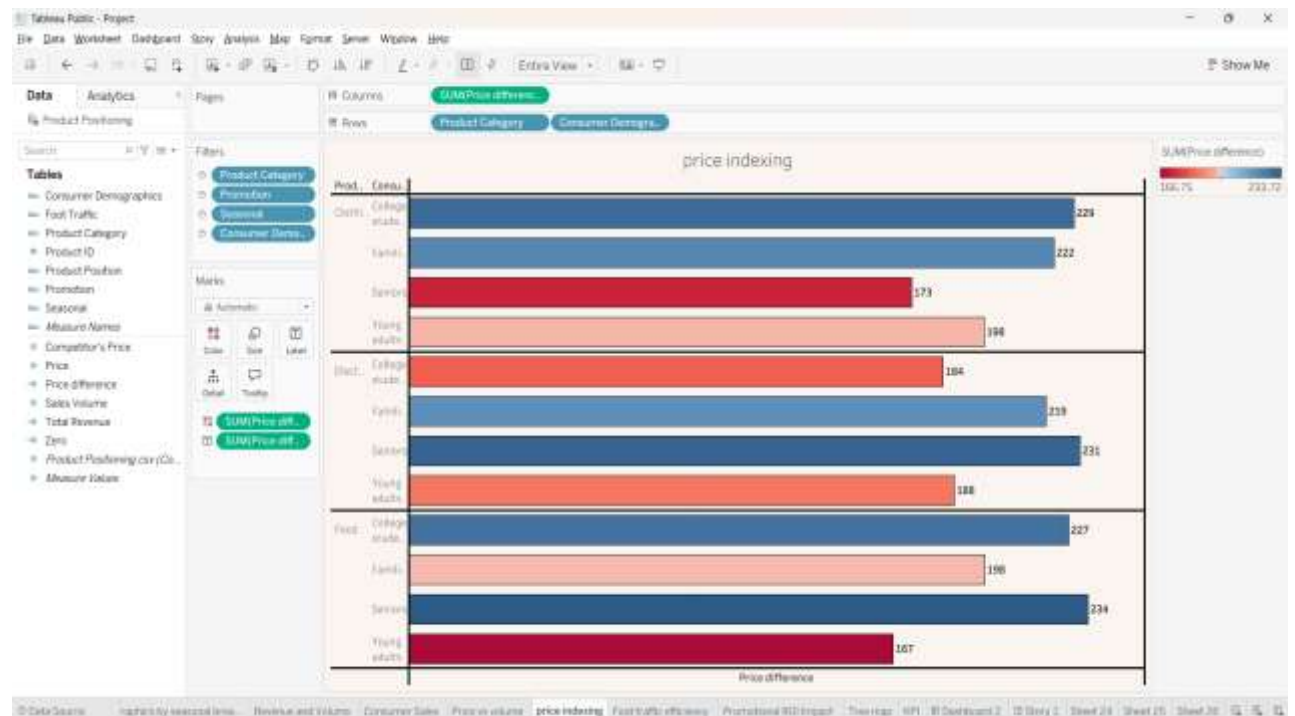

2. Which consumer demographics buy most from specific product categories and from which consumer we are getting highest total sales volume?

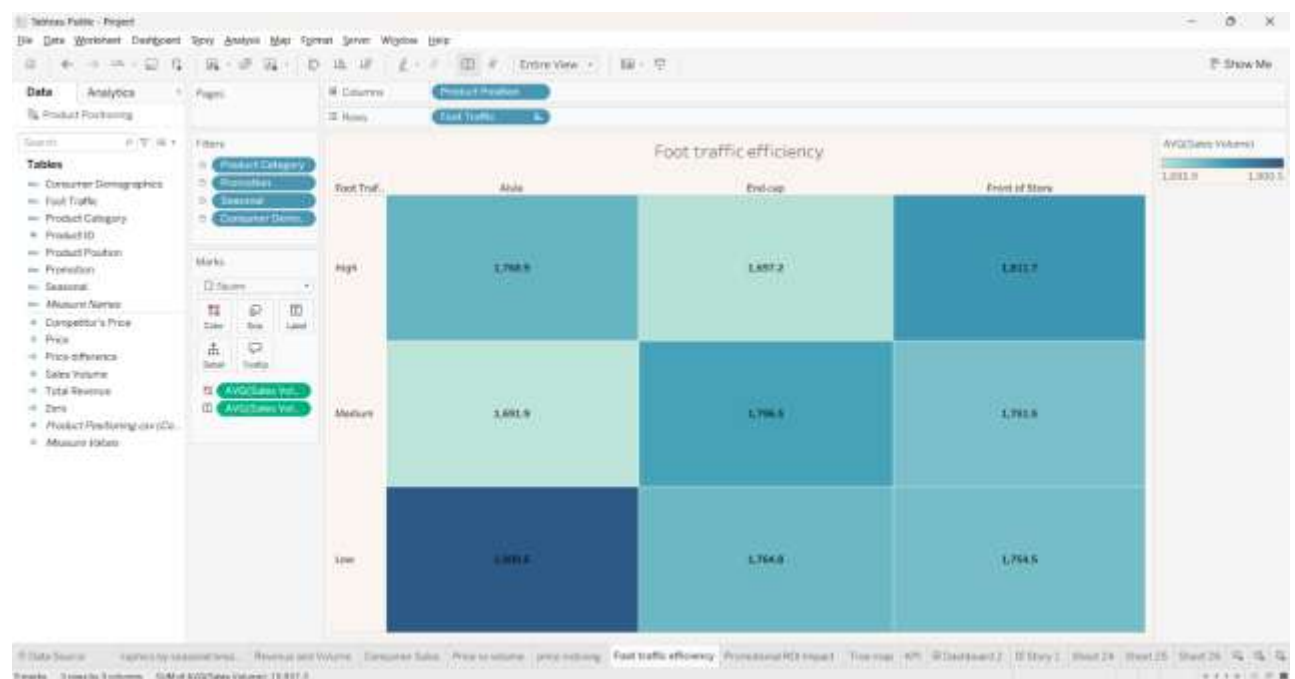

3. How highly-priced items perform against lower-priced items relative to their sales volume?

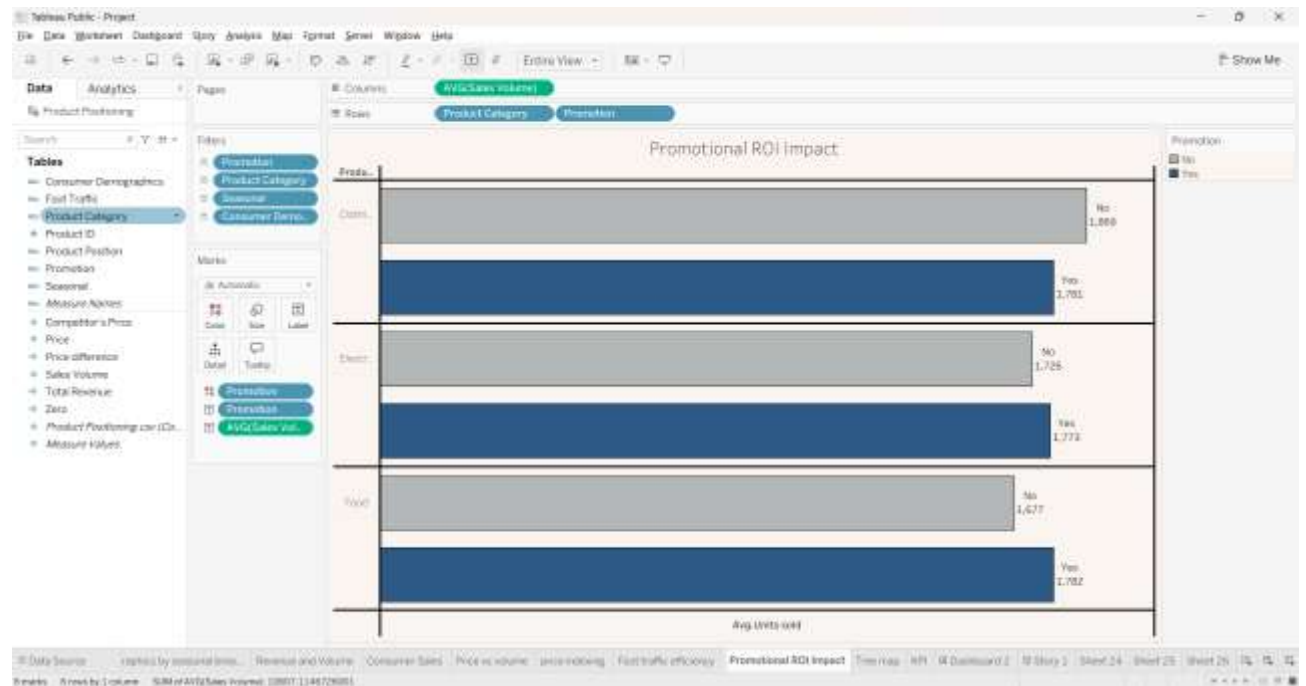

4. How do our current shelf prices compare to the market baseline, and are we underpricing or overpricing our items?

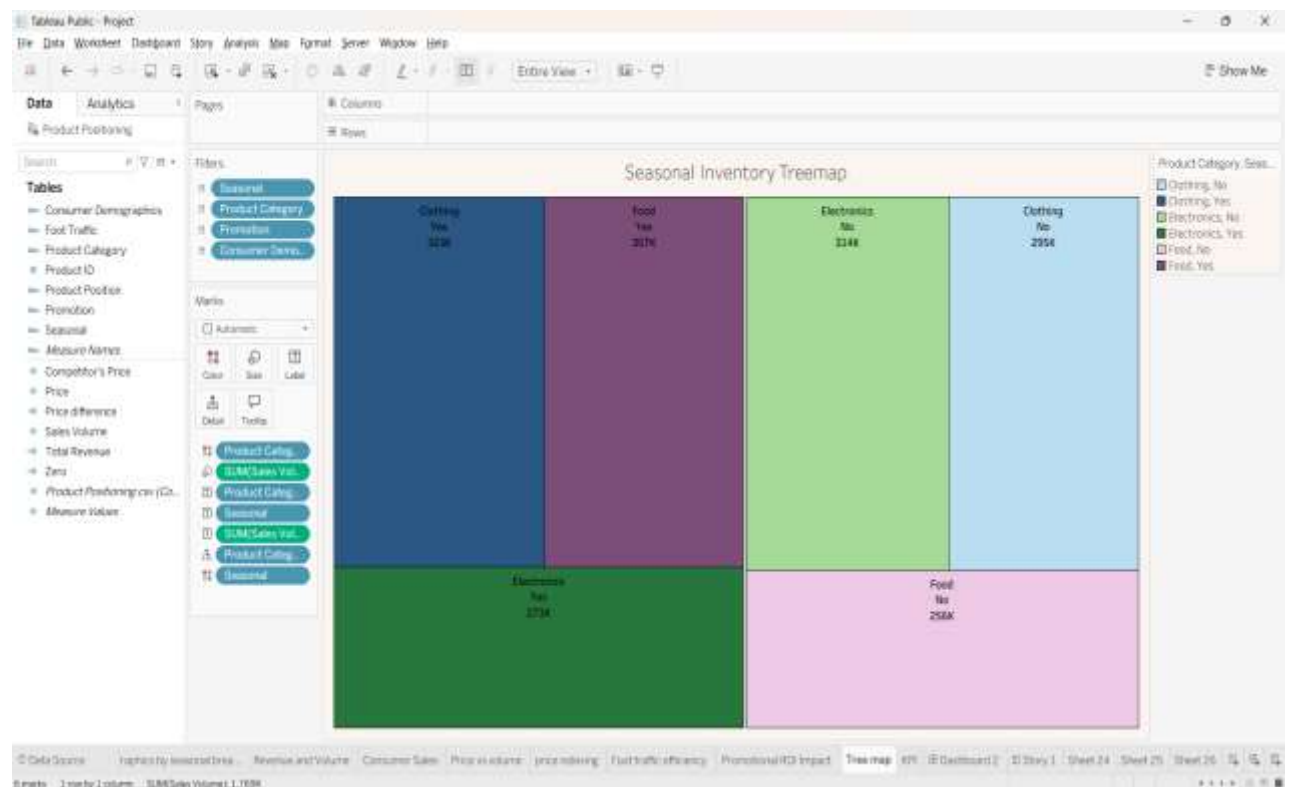

5. How do different product placements within the store interact with varying levels of foot traffic to impact our average sales volume, and where should we allocate inventory to optimize placement efficiency?

6. How much does promotion impact our sales on each product category?

7. How does seasonality impact the total sales volume across our different product categories?

8.KPI (Key Performance Indicator)
